Writing Section

Part 4 要約・意見課題

I hope everyone has read the article for today's class. The article talked about how the use of solar power can benefit us. However, you should also note that solar energy has disadvantages, too. Let's talk about some challenges regarding the use of solar energy.

Firstly, one of the major problems with using solar power is the installation of the system. It's not only costly but also demands space. Let's talk about these. A solar power unit for a single household can easily cost up to two million yen. Most people will probably have to take out a loan to pay for it. In addition, it's not always easy to find enough space to install solar panels. Usually, panels are installed on roofs, but, this can become difficult for people living in apartments because they don't have a large enough roof area.

Also, the amount of power generated by solar panels can be unstable because it depends on the weather. When the weather is bad, we need to rely on electrical power generated by traditional methods. So, it's unrealistic to say that we will stop relying on fossil fuels all together. To solve this problem, we need technology that enables us to make panels with the ability to generate power even in bad weather.

Despite some advantages, introducing solar panels into our daily lives is not as easy as it seems. Now, I would like you to write your opinion about this topic. Make sure you include a short summary of the article and what we discussed in class.
